1. Scope and Objectives of the Course

The course provides a wide scope of learning & understanding of the subject. The main objectives of the course are to:

- Gives students hands-on experience with a project-based approach to systems analysis and design.
- Incorporates object-oriented concepts into traditional techniques.
- Progresses logically through each topic, presenting new material in a way that mirrors a professional analyst's workflow.
- Allows students to apply their own work to real-world examples, including running cases that serve as project templates for a hands-on learning experience.
- Highlights the considerations surrounding SAD concept application with stories of real companies' successes and failures.

2. Course Learning Outcomes

After completion of the course, students will be able to do the following:

CLO01: Distinguish concepts related to processes, threads, process scheduling, race conditions and critical sections.
CLO02: Examine and categorize various memory management techniques like caching, paging, segmentation, virtual memory, and thrashing; Design and implement file management system.
CLO03: Construct the SQL queries for given specifications.
CLO04: Explain the functions of the different layer of the OSI Protocol.
